

BuildMatch MVP

A Tinder-style labour hire app connecting skilled construction workers with builders — built for speed, trust, and real-world job matching. This document outlines the full MVP feature set, architecture decisions, and product flow for your first shippable version.

MVP BLUEPRINT

CONSTRUCTION LABOUR HIRE

What We're Building

BuildMatch is a mobile-first marketplace that operates like Tinder for construction. Workers and builders both create profiles, swipe to connect — either responding to posted work or expressing interest in future collaboration. The app removes the friction of traditional labour hire by letting both sides initiate contact, and communicate in real time.

The MVP is deliberately scoped to prove one core hypothesis: **can a swipe-based mechanic meaningfully improve how builders find workers and how workers find jobs?** Everything in this build either supports that loop or is cut for v2.

For Builders

Browse worker profiles, post jobs, swipe to connect, chat and rate workers after each engagement.

For Workers

Build a verified profile, swipe on posted jobs or builder interest, chat directly.

The Mechanic

Mutual swipe = match. Either party can post or browse. A job board runs parallel for direct applications.

Authentication & Onboarding

The entry point for every user is a phone number — no email, no password, no friction. Firebase Authentication handles OTP delivery and verification out of the box, giving you a secure, low-drop onboarding flow that feels native to a trade audience who rarely sits at a desktop.

After OTP verification, users are immediately prompted to select their role: **Builder** or **Worker**. This single choice gates the entire app experience. The role determines which swipe deck they see, which profile fields they fill out, and which side of the job board they interact with.

Onboarding should be kept to a strict minimum — name, role, profile photo, and one or two key fields. Everything else (skills, certifications, availability) can be completed later but is surfaced progressively through in-app prompts. A partially complete profile should still allow browsing but restrict matching until a completeness threshold is met.

01	02
Enter Phone Number	Verify OTP
User inputs their mobile number. Firebase sends a 6-digit OTP via SMS.	Token is validated client-side via Firebase Auth SDK. Session is created automatically.
03	04
Select Role	Complete Core Profile
User picks Builder or Worker. This is stored in Firestore and drives all downstream logic.	Minimum fields to activate the swipe deck. Full profile completion is progressive.

Worker Profiles

The worker profile is the core unit of value in BuildMatch. It needs to communicate trust and capability at a glance — because a builder swiping through workers is making a split-second judgement the same way they would on Tinder. Profile completeness directly correlates with match rate, so the design should reward filling out every field.

Profile Fields

- **Full name & profile photo** — primary trust signal
- **Trade skills** — multi-select from a predefined taxonomy (carpentry, concreting, electrical rough-in, etc.)
- **Years of experience** — simple numeric input
- **Availability** — calendar-based or simple toggle (available now / available from date)
- **Location & travel radius** — postcode-based with configurable range

Card View Priority

When shown in the swipe deck, the worker card should surface only the most critical signals:

1. Photo + name
2. Primary trade
3. Availability status
4. Distance from job site

Full profile is accessible by tapping the card before swiping.

The Swipe Mechanic

BuildMatch uses a bilateral swipe model — both builders and workers can initiate interest. A match is only created when both parties swipe right, preventing unwanted contact and ensuring mutual intent before any communication begins.

There are two distinct swipe contexts: **Worker Discovery** (builders swiping through worker profiles) and **Job Discovery** (workers swiping through builder profiles or posted jobs). These are separate decks in the UI but share the same underlying match infrastructure.

Once a match is made, both parties receive a push notification and the conversation thread is immediately available in the chat inbox. Unmatched swipes are silent — no notification is sent for a left swipe, reducing social anxiety and encouraging more honest signalling from workers about the jobs they genuinely want.

Swipe Right

Expresses interest. Queued until the other party also swipes right. No notification sent yet.

Swipe Left

Passes on the profile or job. Silent action. Can be undone with a rewind mechanic in v2.

Job Board

The Job Board runs as a separate tab from the swipe deck. It is the more traditional — and often more urgent — side of the marketplace. Builders post specific jobs with structured details, and workers browse or apply directly. This complements the discovery mechanic by catering to time-sensitive hiring needs where a builder has a known start date and scope.

Unlike the swipe deck, the Job Board is **unilateral** — workers apply to posted jobs, and builders review applicants. There is no mutual swipe requirement. However, once a builder accepts an applicant, the system creates a match and unlocks the chat thread, keeping all communication within the same infrastructure.

Job Post Fields

- Job title & trade category
- Location (suburb + postcode)
- Start date & estimated duration
- Pay rate
- Required tickets/licences
- Job description (free text)

Worker Application Flow

- Browse filtered job list
- Tap to view full job details
- One-tap apply with profile attached
- Builder receives notification
- Accept = match + chat unlocked
- Decline = silent, no notification

Ratings & Trust System

A worker with a 4.8-star rating and 23 completed jobs is infinitely more hireable than an identical worker with no history. The rating system in BuildMatch must be simple enough that both parties actually use it, and robust enough that gaming it is difficult from day one.

Ratings are triggered only after a job is marked as complete by the builder — this prevents ratings from being gamed on unstarted engagements.

5-Star Rating

Simple numeric score from 1–5. Aggregate displayed on profile cards and in the swipe deck.

Job Count

Total completed engagements tracked automatically. Displayed alongside the star rating as social proof — a high job count with a moderate rating can still signal reliability.

Report & Block

Any user can report or block another. Reports are queued for manual review.

Payment Structure & Milestones

Structured Payment Plan

Investment is distributed across seven strategic milestones, beginning with a 10% deposit at project initiation. Each subsequent payment is tied to specific deliverables and approvals.

This structure ensures alignment between development progress and financial commitment while providing clear checkpoints for quality assurance and stakeholder review throughout the seven-month timeline.

\$ 16,000

Admin Web Dashboard, App for users

Complete design, development, and beta testing

3–4 Months

Development Timeline

From project kickoff through launch and beta testing completion

1. Design Foundation	10%	2 weeks	Initial look and feel finalization in Figma with 3 different variations of main page
2. Complete UI Design	10%	2 weeks	Entire UI pages in Figma for user side
3. UX Phase	15%	3 weeks	Complete user experience design and flow
4. Technical Architecture	10%	1 week	Database structure and API collection in Postman
5. Development Phase 1	25%	3 weeks	60% app development completion. It includes initial user onboarding, accounts setup, with other basic features for matching.
6. Development Phase 2- Including Admin panel	20%	2 weeks	100% development completion with all the functionalities
7. Launch	10%	2 weeks	Final testing and platform launch

 SUPPORT INCLUDED

Post-Launch Support & Success

One-Year Support Contract

Comprehensive post-launch support included at no additional cost ensures smooth platform operation and rapid issue resolution during the critical first year.

Full Code Ownership

All code developed during this project will be 100% owned by the client, granting complete ownership rights and freedom from any licensing restrictions.
